

Insider-trading probes before and during reports

Identical Llama-generated trajectories replayed through frozen Qwen and Llama | Test n = 200

Layer and C selected on validation only. Dotted line: chance. Report/early features are token means; pre-report is one vector.

Text controls use the report, full available prefix, or exact early window as labeled. All models hold out trajectories from one setting.

Qwen processes saved trajectories here; these are not Qwen-generated trading or deception decisions.
